

Mnemosyne was walking along a cliff near the ocean when she saw two figures flying overhead. The smaller one seemed to be eating something, and therefore not paying attention to how high he was flying. He drew too near the sun – melting the wax which was holding together his feathers – and he plummeted into the ocean at a *steep angle*.

What was the food that caused Icarus' downfall? \_\_\_\_\_

**Step 1: look at ocean slantwise to see text that reads "PRIME SUN RAYS"**  
**Step 2: read the prime sun rays, which tell you to connect the ship's eye to the birds' bodies, and read feathers**  
**Step 3: feathers reveal the answer: "HOT WINGS"**
